### **Encapsulated Underground Lighting Contactor from Sequoia Lighting**

La Habra, CA - Sequoia Lighting Corporation, manufacturers of quality Lighting Products, offers the CLH Series Encapsulated Underground Lighting Contactor.

The Contactor is waterproof and designed to be placed in Pull Boxes for easy access. It is fully encapsulated with high impact resin for maximum protection against harsh environments. The unit is ultra resistant to excessive heating with 480 volts line to line and 277 volts line to neutral capacities.

The Contactor is class CLH rated and configured with up to three poles. It provides a safe and convenient means of remote switching for tungsten and ballast lamp loads and mercury arc lamps. The CLH Series Contactor can be used on flashing applications up to 1,000 cycles per hour.

The CLH Series Contactor features a double break design that reduces electrodynamic forces during high inrush currents. An arc quenching system minimizes the destructive effects on electrical arcs while a higher contact pressure increases current carrying capacity. Arcs that normally pit and gradually destroy the contact material are quickly removed from the contact surface area.

All CLH Series Contactor components manufactured by Sequoia Lighting are fully warranted to be free of defects for three years.

In addition to offering the CLH Series Encapsulated Underground Lighting Contactor, Sequoia Lighting Corporation provides customers with the design, fabrication and installation of quality Nostalgia Lighting products, Roadway Products and HID Lighting Systems.
